What is claimed is:

1. A method for alleviating a symptom of degenerative muscular diseases, comprising:  
administering a therapeutically effective dose of stem cells or progenitor cells transformed with a vector including genes encoding hemagglutinin neuraminidase (HN) and fusion (F) proteins by an intramuscular route to damaged muscle cells of a subject in need thereof,  
wherein the symptom is weakness of muscles.
2. The method of claim 1, wherein the HN and F proteins are derived from sendai virus, human immunodeficiency virus 1, influenza virus or vesicular stomatitis virus.
3. The method of claim 1, wherein the vector is any one selected from the group consisting of a linear DNA plasmid DNA, a non-viral recombinant vector, a viral recombinant vector, and an inducible gene expression vector system.
4. The method of claim 3, wherein the viral recombinant vector is any one selected from the group consisting of

retroviruses, adenoviruses, adeno-associated viruses, helper-dependent adenoviruses, herpes simplex viruses, lentivirus vectors, and vaccinia viruses.

5. The method of claim 1, wherein the degenerative muscular diseases are selected from the group consisting of myopathy, congenital myopathy, congenital muscular dystrophy, Duchenne muscular dystrophy, Becker muscular dystrophy, Limb Girdle muscular dystrophy, facioscapulohumeral muscular dystrophy, oculopharyngeal muscular atrophy, distal muscular dystrophy, Emery-Dreifuss muscular dystrophy, myotonic dystrophy, Barth syndrome, heart failure, and X-linked dilated cardiomyopathy.

6. The method of claim 1, wherein the stem cells or progenitor cells are autologous, allogenic, or xenogenic cells.

7. The method of claim 1, wherein the stem cells are embryonic stem cells, adult stem cells, or induced pluripotent stem cells.
